## Examining the Effects of Gifted Classes on Mathematics and Reading/Language Arts Achievement.

Presentation at SREE 2020 in the
Causal Inference in Clustered Observational Studies using Optimal Multilevel Matching Symposium

By
Daniel Long, Betsy McCoach, and Christopher Rhoads

## Research Question

What is the effect of language arts and mathematics gifted classes on academic achievement of gifted students?

How well does optimal multilevel matching with network flows address selection in a clustered observational study?

## Analytical Approach - Clustered Observational Study

1.We compare the academic achievement in two different groups of schools. One group of schools has gifted content instruction versus a group of schools that does not have gifted content instruction.
2. The school district we are examining allows schools to choose whether they provide gifted instruction in one of three formats:

1. Full time gifted instruction in both reading/language arts (RLA) and mathematics
2. Part time gifted instruction in only mathematics and regular instruction in RLA
3. Part time gifted instruction in only reading/language arts and regular instruction in Math
4. To examine the effect of a given content area, e.g. math, we could compare the math achievement of gifted students in schools with full time gifted instruction vs. only language arts gifted instruction.

## Data

1. A diverse urban southern school district where some schools in the district provide full time gifted instruction (i.e. instruction in both mathematics and language arts) and other schools only provide gifted instruction in mathematics only or language-arts only.
2. Data from gifted students from $2^{\text {nd }}$ to $5^{\text {th }}$ grade for the $17 / 185^{\text {th }}$ grade cohort and the $16 / 175^{\text {th }}$ grade cohort
3. Data on type of gifted program in the school (full time, part-time math, or part-time language arts)
4. Dependent Variable $=5^{\text {th }}$ or $4^{\text {th }}$ grade score on Math or Language Arts State Assessment (We also examined the gain scores in Math or RLA but these results are not shown.)

## Covariates

I. Student Level

1. Free-Reduced Price Lunch (FRPL) Status,
2. English Learner (EL) Status,
3. Female
4. Race/Ethnicity (White is the reference group):
A. Black,
B. Hispanic,
C. Asian,
D. Other
5. 2nd grade math and Reading/Language Arts(RLA) achievement at the student level
II. School Level
6. \%gifted,
7. \%EL,
8. \% FRPL,
9. \% Female
10. \% Black, \% Hispanic,\% Asian, \% Other,
11. average 2 nd grade math and RLA scores at the school level

## Program Selection Effects

How do different types of gifted programs differ in the district?

Are there systematic differences between full time gifted programs versus part-time Math and part-time language arts programs?

## Large Selection Effect Across Different Types of Programs

## Academic Achievement, School Poverty, and Student Poverty by type of Gifted Program for $4^{\text {th }}$-grade

Figure 1:
Program Characteristics for Cohort 1, 4th Grade

- Schools with part-time language arts gifted instruction have lower levels of math achievement (335) compared to full-time (340) and part-time math schools (339) The part time LA schools have an effect size of .33 lower than full time gifted schools in math achievement. Part time LA schools also have an effect size of .27 lower than part time math schools in math achievement.

Schools with part-time language arts gifted instruction have higher levels of student poverty compared to full-time and part-time math schools

- Schools with Part-time gifted Mathematics instruction had lower levels of student poverty than full-time and part-time Language Arts Schools

## Distribution of School \% FRPL

|  |  | Grade 5 Cohort 2 | 482 | 44 |

## Research Question

## What is the effect of language arts and mathematics gifted classes on academic achievement of gifted students?

How well does optimal multilevel matching with network flows address selection in a clustered observational study?

## Methods: Six Different Approaches to Compare Treatment and Control Groups

1. OLS without covariates
2. OLS with covariates
3. Propensity Score weighting without covariates
4. Propensity Score weighting with covariates

For the propensity score matching the extreme values were trimmed and stabilized based on the methods in Harder, Stuart, \& Anthony (2010).
5. Multi-level matching without covariates
6. Multi-level matching with covariates

Multilevel Matching based on the R package multi-match, which consists of a two-staged multilevel matching procedure (Pimentel, Page, \& Keele 2018)

## Methods:

## Propensity Score Weighting

1. Calculated a propensity score with the following covariates:

- Student Level:

FRPL, EL, Race/Ethnicity, 2nd grade math and reading/ELA achievement at the student level

- School Level:
\%gifted, \%EL, \% FRPL, \% Black, \% Hispanic, average 2nd grade math and reading/ELA scores at the school level

2. Used the propensity score to created an ATE inverse probability weight (IPW) for all observations
3. Extreme values were trimmed and stabilized based on the methods in Harder, Stuart, \& Anthony (2010). We bottom-coded the IPTW at 0.1 and top-coded the IPTW at 10 .
4. Estimated a weighted generalized linear model using propensity score weights as survey weights with the package svyglm in $R$

## Methods: <br> Multi-Level Matching

1. We used the R-package multiMatch to do a two stage multi-level matching of first matching students then matching schools (Pimentel, Page, \& Keele 2018).
2. We included the following variables for the student level matching:

FRPL, Black, Hispanic, 2nd grade math and reading/ELA achievement at the student level
3. For the school level matching, we used the following variables:
\%gifted, \% FRPL, \% Black, \% Hispanic, average 2nd grade math and reading/ELA scores at the school level.
4. MultiMatch uses fine balance at the school level which required converting all continuous variables into 6 -category ordinal variables. We also gave priority to school percent FRPL and school percent gifted.
5. We set the tolerance to .1 for the matching.
6. After matching, we estimated a multilevel model using the Ime package in R.

# Results - Balance Comparisons 

## Comparison: Gifted Math(FT) vs. Regular Math <br> Outcome: Math

Balance measured with the mean standardized difference for of all covariates
Table 1: Mean Standardized Difference for Baseline, Propensity Score Weighting, and Multilevel Matching

|  | OLS | Propensity Score <br> Weighting | Multilevel <br> Matching |
| :--- | :---: | :---: | :---: |
| Grade 4 Cohort 1 | 0.51 | 0.37 | 0.17 |
| Grade 5 Cohort 1 | 0.5 | 0.32 | 0.12 |

(Note: highlighted cells have adequate balance due to small differences between covariate means. We define an adequate balance as a mean standardized difference of less than .2)

Table 1B: Sample Size for Baseline, Propensity Score Weighting, and Multilevel Matching

|  | OLS |  | Propensity Score Weighting |  | Multilevel Matching |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Students | Schools | Students | Schools | Students | Schools |
| Grade 4 Cohort 1 | 2303 | 111 | 2303 | 111 | 512 | 56 |
| Grade 5 Cohort 1 | 2291 | 111 | 2291 | 111 | 468 | 52 |

Notes: *= p-value<=.01; Statistically significant coefficients are highlighted; Standard Error in Brackets; Standardize Coef.
Key Findings:

- No positive and statistically significant effects of gifted Math instruction with OLS, propensity score weighting or multi-level matching models
- Cohort 2 can be viewed as a replication of cohort 1 , we find consistent results for cohorts 1 and 2

## Results: Gifted LA (Full-Time) vs. Regular LA

Comparison: Gifted LA (FT) vs. Regular LA (in schools with part time gifted Math classes)
Table 5: Outcome: Language Arts

| Comparison | Cohort | Grade | Ordinary Least Squares Regression |  | Propensity Score Weighting |  | Multi-level Matching |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Notes: "= p-vaıue<=.U1; statıstıcalıy sıgnıticant coetticıents are nıgniggntea; stangara trror in brackets; stanaaraized Coef.
Key Findings:

- No Positive Effect of Gifted Language Arts Instruction with OLS, propensity score weighting or multi-level matching models
- Limited consistency between the $4^{\text {th }}$ and $5^{\text {th }}$ grade cohort 1 statistically significant results and the $4^{\text {th }}$ and $5^{\text {th }}$ grade statistically significant results

## Sensitivity Tests

1. A Comparison of Matching Strategies
2. Comparison of Strategies used to identify school level variables used with fine balance
3. The impact of prioritization with skewed and balanced covariates

# Comparison of Matching Strategies for the Full-time Gifted vs. Part-time Language Arts Comparison 

| Matching Strategy | Mean Standardized <br> Difference | Student N | School N |
| :--- | :---: | :---: | :---: |
| Match School only | .45 | 1082 | 60 |
| Match School and Students | .39 | 605 | 60 |
| Match School and Students with <br> fine balance without prioritizing | .29 | 279 | 22 |
| Match School and Students with <br> fine balance and prioritizing <br> \%FRPL and \% gifted at the <br> school level | .17 | 512 | 56 |

# Comparison of Different Sets of Covariates Used for Fine Balance 

for the Full-time Gifted vs. Part-time Language Arts Comparison

| Covariates Used for Fine Balance | MSD | Student N | School N |
| :---: | :---: | :---: | :---: |
| Raw Standardized Diff. >=. 7 (\% FRPL school mean, 2nd grade Math and ELA mean, \% gifted school mean, \% black \& \% white school mean; Prioritizing \% FRPL then \% gifted) | . 23 | 539 | 60 |
| Raw Standardized Diff. >=1.1 (\% FRPL school mean, $2^{\text {nd }}$ grade Math and ELA school mean; Prioritizing \% FRPL) | . 19 | 489 | 56 |

| All School Level Covariates (Prioritizing \% FRPL then \% <br> gifted) | .18 | 489 | 56 |
| :--- | :--- | :--- | :--- |
| Theoretically informed subset of variables (FRL, <br> Black, Latino, and 2nd grade each. At the school and student level plus <br> \% gifted at school level ; Prioritizing \% FRPL then \% gifted) | .17 | 512 | 56 |

## Comparison of Different Variables Used for Prioritization for the Full-time Gifted vs. Part-time Language Arts Comparison

| Prioritization <br> Variable | Mean <br> Standardized <br> Difference | Student N | School <br> N | RLA School <br> Avg. Std. Diff. | Math School <br> Avg. Std. <br> Diff. | \% FRL <br> School Avg. <br> Std. Diff. | \% Gifted <br> School Avg. <br> Std. Diff. |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Prioritizing \%FRPL <br> and \% gifted at the <br> school level | .17 | 512 | 56 | $.556^{*}$ | $.304^{*}$ | $-.572^{*}$ | .020 |
| Prioritizing school <br> avg. RLA and avg. <br> Math | .14 | 363 | 38 | .106 | .029 | $-.668^{*}$ | .112 |
| Prioritizing \%FRPL | .17 | 512 | 56 | $.556^{*}$ | $.304^{*}$ | $-.572^{*}$ | .228 |
| Prioritizing \% Gifted | .24 | 550 | 60 | $.704^{*}$ | $.491^{*}$ | $-.765^{*}$ | .041 |
| Raw Data for <br> Reference: | .51 | 2303 | 111 | $1.448^{*}$ | $1.258^{*}$ | $-1.158^{*}$ | $1.052^{*}$ |

## Distribution of School \% FRPL

Distribution of School \% FRPL
by Program for 4th grade 15/16

Part-time language arts gifted instruction

# Distribution of Avg. $2^{\text {nd }}$ Grade Math Achievement 

Distribution of School Avg. 2nd Grade
Math Achievement by Program for 4th grade 15/16

Part-time language arts gifted instruction

[^1]
## Distribution of Avg. $2^{\text {nd }}$ Grade RLA Achievement

## Conclusion

- No Effect of Gifted RLA or Gifted Math Classes on Academic Achievement. Multiple methods found no effect:
- Simple OLS with Covariates
- Propensity Score Weighting
- Multilevel Optimal Matching
- In our case of highly unbalanced data, Multilevel Optimal Matching was able to identify more balanced sample compared to the balance achieved with propensity score weighting in 13 out of 16 comparisons.
- Half of the matched samples had a balance less than .2. However, balance was obtained by substantially decreasing the sample size.
- Sensitivity tests (with one comparison) find:
- Multilevel Optimal Matching required the use of both fine balance and prioritizing school level covariates to obtain a balance less than . 2
- Theoretically Informed Selection of covariates performed better than covariates for fine balance selected only by level of mean standardized difference
- Symmetric distributions balance better than highly skewed distributions

[^0]:    \# of bins=20 for each histogram
