Replicating Studies: When treatment effects replicate and when they don't
Organizer: Carol Connor
Discussant: Karen Douglas

The purpose of this panel is to discuss advantages of replicating intervention studies, why effects replicate and why they do not, and the insights such findings provide. Participants of this panel will present replication studies focusing on the following 4 issues:

1. How do the characteristics of study participants and program contexts, including interventions, influence the replication or non-replication, of treatment effects?
2. How might researchers collaborate with practitioners to successfully transition replications from laboratory settings to classrooms and schools?
3. When are controlled efficacy trials of promising interventions likely to replicate in effectiveness trials, or trials at scale?
4. How might practitioners and researchers learn from follow-up studies that fail to replicate published research findings?
